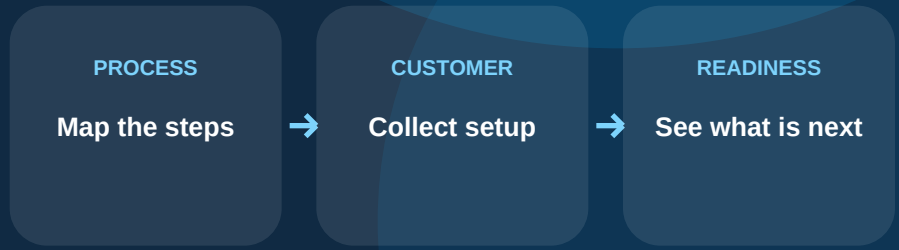
B2B SAAS IMPLEMENTATION WORKSPACE

Turn customer onboarding into a clear path to launch.

A shared workspace to organize implementation steps, guide customer setup, and see what still needs attention.



THE CHALLENGE

Customer setup has many moving parts

A new business customer may need to share information, complete setup tasks, and coordinate with several people before launch.

WITHOUT ONE SHARED VIEW

- **Messages**
  Requests and answers spread across threads
- **Spreadsheets**
  Tasks and owners are easy to miss
- **Follow-ups**
  Blockers and next steps are hard to see

WITH RELAY

- **A repeatable process**
  Keep the steps, instructions, and owners together
- **Customer setup in one place**
  Request information through a private link
- **Visible readiness gaps**
  Spot work that is missing, blocked, or overdue

HOW IT WORKS

A simple path from process to launch

Build the process once, then use it to guide each customer implementation.

01

Map

Write stages and ordered steps. Add instructions, owners, due dates, and prerequisites.

02

Check and save

Review the process, fix gaps, then save a reusable template.

03

Start customer work

Create an implementation for a customer from the template.

04

Track readiness

Collect setup details and see tasks that need attention.

The same workspace connects process steps, customer information, and implementation tasks.

CORE FEATURES | 1 OF 2

Design a process your team can repeat

Set up the way your team works, check it, and reuse it for the next customer.

1 Process maps

Arrange stages and steps; add instructions, responsible roles, team assignments, due-date offsets, and prerequisite steps.

2 Process checks

Check for missing instructions, owners, member assignments, and prerequisite-order issues before saving a process as a template.

3 Reusable templates

Save a tested process snapshot for future implementations. Review template versions and restore an earlier version when needed.

Why teams use this

A consistent starting point helps the team follow the same steps without rebuilding the plan for every customer.

CORE FEATURES | 2 OF 2

Run each customer implementation

Turn a reusable process into customer-specific work and keep an eye on what is holding progress up.

4 Implementation tracking

Start from a template and manage each customer’s tasks, owners, status, due dates, blockers, and next actions.

5 Customer information links

Request setup details through a private link. Choose response types and required fields; Relay validates responses.

6 Readiness gaps

Find missing or invalid responses, overdue or blocked work, unassigned tasks, and steps waiting on prerequisites.

Find the work that needs attention

Search implementations by customer or template, then filter by status, owner, or attention type.

TECHNOLOGY

The technology behind Relay

A web application with a browser interface, server-side business logic, and a managed relational database.

BROWSER EXPERIENCE	**HTML + CSS + JavaScript**	The screens and interactions used by the Relay team and customers.
APPLICATION SERVER	**Node.js + Express**	Handles sign-in, workspace access, workflow actions, and API requests.
DATA STORAGE	**PostgreSQL + Supabase**	Stores workspaces, process maps, templates, tasks, and submitted information.
HOSTING	**Vercel**	Hosts the website and serverless application endpoints.

OPTIONAL AI HELP Ray can explain Relay and guide users when the OpenAI connection is configured.

THE SHORT VERSION

One place to guide a customer from kickoff to ready.

Relay helps B2B SaaS teams standardize implementation steps, coordinate customer setup, and see what still needs attention.

REPEAT

Use a tested process again.

COORDINATE

Track tasks and setup details.

SEE WHAT IS NEXT

Spot gaps before they linger.
